

# Forward and Inverse Kinematic Analysis and Validation of the ABB IRB 140 Industrial Robot

Mohammed Almaged<sup>1</sup>

**Abstract** - The main goal of this paper is to derive the forward and inverse kinematic model of the ABB IRB 140 industrial manipulator. Denavit-Hartenberg analysis (DH) is presented to write the forward kinematic equations. Initially, a coordinate system is attached to each of the six links of the manipulator. Then, the corresponding four link parameters are determined for each link to construct the six transformation matrices ( ${}^{i-1}T_i$ ) that define each frame  $\{i\}$  relative to the previous one  $\{i-1\}$ . While, to develop the kinematics that calculates the required joint angles ( $\theta_1 - \theta_6$ ), both geometrical and analytical approaches are used to solve the inverse kinematic problem. After introducing the forward and inverse kinematic models, a MATLAB code is written to obtain the solutions of these models. Then, the forward kinematics is validated by examining a set of known positions of the robot arm, while the inverse kinematics is checked by comparing the results obtained in MATLAB with a simulation in Robot Studio.

**Keywords** - Robotics, forward kinematics, inverse kinematics, ABB IRB 140 manipulator

## 1. Introduction

'Kinematics is the science of geometry in motion' [1]. This means it deals only with geometrical issues of motion such as the position and orientation regardless the force that causes them. There are two types of kinematics, the forward and inverse kinematics. Forward kinematic analysis is concerned with the relationship between the joint angle of the robot manipulator and the position and orientation of the end-effector [2]. In other words, it deals with finding the homogeneous transformation matrix that describes the position and orientation of the tool frame with respect to the global reference frame. On the other hand, inverse kinematics is used to calculate the joint angles required to achieve the desired position and orientation. The same transformation matrix which resulted from the forward kinematics in order to describe the position and the orientation of the tool frame relative to the robot base frame is used here in the inverse kinematics to solve for the joint angles.

The IRB 140, shown in Figure 1 below, is compact six axes (6 DOF) industrial manipulator. It is designed with six revolute joints providing a flexible use at an outstanding accuracy to be suitable for a wide range of applications such as welding, packing, assembly, etc.

## 2. Forward Kinematics

To mathematically model a robot and hence determine the position and orientation of the end effector with respect to the base or any other point, it is necessary to assign a global coordinate frame to the base of the robot and a local reference frame at each joint. Then, the Denavit-Hartenberg analysis (DH) is presented to build the homogeneous transformations matrices between the robot joint axes [3]. These matrices are a function of four parameters resulted from a series of translations and rotations around different axes. The illustration of how frame  $\{i\}$  is related to the previous frame  $\{i-1\}$  and the description of the frame parameters are shown in Figure 2 below.

Figure 2. The description of frame  $\{i\}$  with respect to frame  $\{i-1\}$  [3]

From Figure 2, the modified D-H parameters can be described as:

- $\alpha_{i-1}$ : Twist angle between the joint axes  $Z_i$  and  $Z_{i-1}$  measured about  $X_{i-1}$ .
- $a_{i-1}$ : Distance between the two joint axes  $Z_i$  and  $Z_{i-1}$  measured along the common normal.
- $\theta_i$ : Joint angle between the joint axes  $X_i$  and  $X_{i-1}$  measured about  $Z_i$ .
- $d_i$ : Link offset between the axes  $X_i$  and  $X_{i-1}$  measured along  $Z_i$ .

Thus, the four Transformations between the two axes can be defined as:

$${}^{i-1}_iT = Rot(X_{i-1}, \alpha_{i-1}) \times Trans(X_{i-1}, a_{i-1}) \times Rot(Z_i, \theta_i) \times Trans(0, 0, d_i)$$

After finishing the multiplication of these four transformation, the homogeneous transform can be obtained as:

$${}^{i-1}_iT = \begin{pmatrix} c_{\theta_i} & -s_{\theta_i} & 0 & a_{i-1} \\ s_{\theta_i}c_{\alpha_{i-1}} & c_{\theta_i}c_{\alpha_{i-1}} & -s_{\alpha_{i-1}} & -d_i s_{\alpha_{i-1}} \\ s_{\theta_i}s_{\alpha_{i-1}} & c_{\theta_i}s_{\alpha_{i-1}} & c_{\alpha_{i-1}} & d_i c_{\alpha_{i-1}} \\ 0 & 0 & 0 & 1 \end{pmatrix} \quad (1.1)$$

The ABB IRB140 frames assignment is shown below in Figure 3.

**Figure 3.** ABB IRB140 frames assignment

According to our particular frame assignment, the modified D-H parameters are defined in Table 1 below.

**Table 1.** Hata! Belirtilen stilde metne rastlanmadı.. The ABB IRB 140 D-H parameters

Axis (i)	$\alpha_{i-1}$	$a_{i-1}$	$d_i$	$\theta_i$
1	0	0	$d_1 = 352$	$\theta_1$
2	-90	$a_1 = 70$	0	$\theta_2-90$
3	0	$a_2 = 360$	0	$\theta_3$
4	-90	0	$d_4 = 380$	$\theta_4$
5	90	0	0	$\theta_5$
6	-90	0	0	$\theta_6$

For the simplicity of calculations and matrix product, it can be assumed that  $s_2 = \sin (\theta_2-90)$ ,  $c_2 = \cos (\theta_2-90)$ . After achieving the D-H Table 1, the individual transformation matrix for each link is achieved by substituting the link parameters into the general homogeneous transform derived above in (1.1).

$${}^0_1T = \begin{pmatrix} c_{\theta_1} & -s_{\theta_1} & 0 & a_0 \\ s_{\theta_1}c_{\alpha_0} & c_{\theta_1}c_{\alpha_0} & -s_{\alpha_0} & -d_1s_{\alpha_0} \\ s_{\theta_1}s_{\alpha_0} & c_{\theta_1}s_{\alpha_0} & c_{\alpha_0} & d_1c_{\alpha_0} \\ 0 & 0 & 0 & 1 \end{pmatrix} \quad {}^0_1T = \begin{pmatrix} c_1 & -s_1 & 0 & 0 \\ s_1 & c_1 & 0 & 0 \\ 0 & 0 & 1 & d_1 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^1_2T = \begin{pmatrix} c_{\theta_2} & -s_{\theta_2} & 0 & a_1 \\ s_{\theta_2}c_{\alpha_1} & c_{\theta_2}c_{\alpha_1} & -s_{\alpha_1} & -d_2s_{\alpha_1} \\ s_{\theta_2}s_{\alpha_1} & c_{\theta_2}s_{\alpha_1} & c_{\alpha_1} & d_2c_{\alpha_1} \\ 0 & 0 & 0 & 1 \end{pmatrix} \quad {}^{01}_2T = \begin{pmatrix} c_2 & -s_2 & 0 & a_1 \\ 0 & 0 & 1 & 0 \\ -s_2 & -c_2 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^2_3T = \begin{pmatrix} c_{\theta_3} & -s_{\theta_3} & 0 & a_2 \\ s_{\theta_3}c_{\alpha_2} & c_{\theta_3}c_{\alpha_2} & -s_{\alpha_2} & -d_3s_{\alpha_2} \\ s_{\theta_3}s_{\alpha_2} & c_{\theta_3}s_{\alpha_2} & c_{\alpha_2} & d_3c_{\alpha_2} \\ 0 & 0 & 0 & 1 \end{pmatrix} \quad {}^2_3T = \begin{pmatrix} c_3 & -s_3 & 0 & a_2 \\ s_3 & c_3 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^3_4T = \begin{pmatrix} c_{\theta_4} & -s_{\theta_4} & 0 & a_3 \\ s_{\theta_4}c_{\alpha_3} & c_{\theta_4}c_{\alpha_3} & -s_{\alpha_3} & -d_4s_{\alpha_3} \\ s_{\theta_4}s_{\alpha_3} & c_{\theta_4}s_{\alpha_3} & c_{\alpha_3} & d_4c_{\alpha_3} \\ 0 & 0 & 0 & 1 \end{pmatrix} \quad {}^3_4T = \begin{pmatrix} c_4 & -s_4 & 0 & 0 \\ 0 & 0 & 1 & d_4 \\ -s_4 & -c_4 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^4_5T = \begin{pmatrix} c_{\theta_5} & -s_{\theta_5} & 0 & a_4 \\ s_{\theta_5}c_{\alpha_4} & c_{\theta_5}c_{\alpha_4} & -s_{\alpha_4} & -d_5s_{\alpha_4} \\ s_{\theta_5}s_{\alpha_4} & c_{\theta_5}s_{\alpha_4} & c_{\alpha_4} & d_5c_{\alpha_4} \\ 0 & 0 & 0 & 1 \end{pmatrix} \quad {}^4_5T = \begin{pmatrix} c_5 & -s_5 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ s_5 & c_5 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^5_6T = \begin{pmatrix} c_{\theta_6} & -s_{\theta_6} & 0 & a_5 \\ s_{\theta_6}c_{\alpha_5} & c_{\theta_6}c_{\alpha_5} & -s_{\alpha_5} & -d_6s_{\alpha_5} \\ s_{\theta_6}s_{\alpha_5} & c_{\theta_6}s_{\alpha_5} & c_{\alpha_5} & d_6c_{\alpha_5} \\ 0 & 0 & 0 & 1 \end{pmatrix} \quad {}^5_6T = \begin{pmatrix} c_6 & -s_6 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -s_6 & -c_6 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

Once the homogeneous transformation matrix of each link is obtained, forward kinematic chain can be applied to achieve the position and orientation of the robot end-effector with respect to the global reference frame (robot base).

$${}^0_2T = {}^0_1T \times {}^1_2T$$

$${}^0_2T = \begin{pmatrix} c_1 & -s_1 & 0 & 0 \\ s_1 & c_1 & 0 & 0 \\ 0 & 0 & 1 & d_1 \\ 0 & 0 & 0 & 1 \end{pmatrix} \times \begin{pmatrix} c_2 & -s_2 & 0 & a_1 \\ 0 & 0 & 1 & 0 \\ -s_2 & -c_2 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} c_1c_2 & -c_1s_2 & -s_1 & c_1a_1 \\ s_1c_2 & -s_1s_2 & c_1 & s_1a_1 \\ -s_2 & -c_2 & 0 & d_1 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^0_3T = {}^0_2T \times {}^2_3T$$

$${}^0_3T = \begin{pmatrix} c_1c_2 & -c_1s_2 & -s_1 & c_1a_1 \\ s_1c_2 & -s_1s_2 & c_1 & s_1a_1 \\ -s_2 & -c_2 & 0 & d_1 \\ 0 & 0 & 0 & 1 \end{pmatrix} \times \begin{pmatrix} c_3 & -s_3 & 0 & a_2 \\ s_3 & c_3 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^0_3T = \begin{pmatrix} c_1c_2c_3 - c_1s_2s_3 & -(c_1c_2s_3 + c_1s_2c_3) & -s_1 & c_1c_2a_2 + c_1a_1 \\ s_1c_2c_3 - s_1s_2s_3 & -(s_1c_2s_3 + s_1s_2c_3) & c_1 & s_1c_2a_2 + s_1a_1 \\ -(s_2c_3 + c_2s_3) & s_2s_3 - c_2c_3 & 0 & -s_2a_2 + d_1 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^0_3T = \begin{pmatrix} c_1c_{23} & -c_1s_{23} & -s_1 & c_1(c_2a_2 + a_1) \\ s_1c_{23} & -s_1s_{23} & c_1 & s_1(c_2a_2 + a_1) \\ -s_{23} & -c_{23} & 0 & -s_2a_2 + d_1 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^4_6T = {}^4_5T \times {}^5_6T$$

$${}^4_6T = \begin{pmatrix} c_5 & -s_5 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ s_5 & c_5 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \times \begin{pmatrix} c_6 & -s_6 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -s_6 & -c_6 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} c_5c_6 & -c_5s_6 & -s_5 & 0 \\ s_6 & c_6 & 0 & 0 \\ s_5c_6 & -s_5s_6 & c_5 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^3_6T = {}^3_4T \times {}^4_6T$$

$${}^3_6T = \begin{pmatrix} c_4 & -s_4 & 0 & 0 \\ 0 & 0 & 1 & d_4 \\ -s_4 & -c_4 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \times \begin{pmatrix} c_5c_6 & -c_5s_6 & -s_5 & 0 \\ s_6 & c_6 & 0 & 0 \\ s_5c_6 & -s_5s_6 & c_5 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^3_6T = \begin{pmatrix} c_4c_5c_6 - s_4s_6 & -c_4c_5s_6 - s_4c_6 & -c_4s_5 & 0 \\ s_5c_6 & -s_5s_6 & c_5 & d_4 \\ -s_4c_5c_6 - c_4s_6 & s_4c_5s_6 - c_4c_6 & s_4s_5 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^0_6T = {}^0_3T \times {}^3_6T$$

$${}^0_6T = \begin{pmatrix} c_1c_{23} & -c_1s_{23} & -s_1 & c_1(c_2a_2 + a_1) \\ s_1c_{23} & -s_1s_{23} & c_1 & s_1(c_2a_2 + a_1) \\ -s_{23} & -c_{23} & 0 & -s_2a_2 + d_1 \\ 0 & 0 & 0 & 1 \end{pmatrix} \times \begin{pmatrix} c_4c_5c_6 - s_4s_6 & -c_4c_5s_6 - s_4c_6 & -c_4s_5 & 0 \\ s_5c_6 & -s_5s_6 & c_5 & d_4 \\ -s_4c_5c_6 - c_4s_6 & s_4c_5s_6 - c_4c_6 & s_4s_5 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$${}^0_6T = \begin{pmatrix} r_{11} & r_{12} & r_{13} & x \\ r_{21} & r_{22} & r_{23} & y \\ r_{31} & r_{32} & r_{33} & z \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$$\begin{aligned}
r_{11} &= c_1 c_{23} (c_4 c_5 c_6 - s_4 s_6) - c_1 s_{23} s_5 c_6 + s_1 (s_4 c_5 c_6 + c_4 s_6) \\
r_{12} &= c_1 c_{23} (-c_4 c_5 s_6 - s_4 c_6) + c_1 s_{23} s_5 s_6 - s_1 (s_4 c_5 s_6 - c_4 c_6) \\
r_{13} &= -c_1 c_{23} c_4 s_5 - c_1 s_{23} c_5 - s_1 s_4 s_5 \\
r_{21} &= s_1 c_{23} (c_4 c_5 c_6 - s_4 s_6) - s_1 s_{23} s_5 c_6 - c_1 (s_4 c_5 c_6 + c_4 s_6) \\
r_{22} &= s_1 c_{23} (-c_4 c_5 s_6 - s_4 c_6) + s_1 s_{23} s_5 s_6 + c_1 (s_4 c_5 s_6 - c_4 c_6) \\
r_{23} &= -s_1 c_{23} c_4 s_5 - s_1 s_{23} c_5 + c_1 s_4 s_5 \\
r_{31} &= -s_{23} (c_4 c_5 c_6 - s_4 s_6) - c_{23} s_5 c_6 \\
r_{32} &= -s_{23} (-c_4 c_5 s_6 - s_4 c_6) + c_{23} s_5 s_6 \\
r_{33} &= s_{23} c_4 s_5 - c_{23} c_5 \\
x &= -d_4 c_1 s_{23} + c_1 (c_2 a_2 + a_1) \\
y &= -d_4 s_1 s_{23} + s_1 (c_2 a_2 + a_1) \\
z &= -s_2 a_2 + d_1 - d_4 c_{23}
\end{aligned}$$

Now, it is also possible to find the position of the tip (TCP) with respect to the robot base. According to the robot frame assignment, it is simply a transition along the z axis of frame  $\{6\}$  by  $d_6$  (65 mm). Therefore, the final position of the end effector with respect to the robot global reference frame can be expressed as:

$$P_{tip} = {}^0T X P^6$$

$$P_{tip} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & x \\ r_{21} & r_{22} & r_{23} & y \\ r_{31} & r_{32} & r_{33} & z \\ 0 & 0 & 0 & 1 \end{pmatrix} X \begin{pmatrix} 0 \\ 0 \\ d_6 \\ 1 \end{pmatrix} = \begin{pmatrix} d_6 X r_{13} + x \\ d_6 X r_{23} + y \\ d_6 X r_{33} + z \\ 1 \end{pmatrix}$$

### 3. Forward Kinematic Validation

After finding the homogeneous transformation matrix ( ${}^0T$ ) that describes the end effector position and orientation with respect to the robot global reference frame, the position of the robot in space is expressed by the vector  ${}^0P_{6ORG}$  which gives the values of x, y and z vectors as follow:

$$\begin{aligned}
x &= -d_4 c_1 s_{23} + c_1 (c_2 a_2 + a_1) \\
y &= -d_4 s_1 s_{23} + s_1 (c_2 a_2 + a_1) \\
z &= -s_2 a_2 + d_1 - d_4 c_{23}
\end{aligned}$$

h that:  $S_2 = \sin(\theta_2 - 90)$ ,  $C_2 = \cos(\theta_2 - 90)$ ,  $d_1 = 352$  mm,  
 $d_4 = 380$  mm,  $a_1 = 70$  mm and  $a_2 = 360$  mm.

These equations are programmed in Matlab and a set of eight positions, illustrated below in Figure 4, were chosen randomly to validate the forward kinematic model. The joint angles of each position are entered manually by the user to obtain the x, y and z vectors as shown in Table 2 below. It can be clearly seen that there is no y component corresponding to these particular positions because  $\Theta_1$  is always given to be zero. The same joint angle values were entered through the robot operating software in the lab and the results were similar to the x, y and z vectors obtained from Matlab which proves the validity of this model.

**Figure 4.** Set of different robot positions

#### 4. Inverse Kinematics

Inverse kinematics is used to calculate the joint angles required to achieve the desired position and orientation in the robot workspace. In general, there are two methods of solution, the analytical and geometrical approaches. Since three consecutive axes of the robot intersect at a common point, Pieper's solution can be applied. Pieper's approach works on the principle of separating the position solution for  $\theta_1$ ,  $\theta_2$  and  $\theta_3$  from the orientation solution to solve for  $\theta_4$ ,  $\theta_5$  and  $\theta_6$  [4]. Therefore, a geometrical approach is initially implemented to find the joint variables  $\theta_1$ ,  $\theta_2$  and  $\theta_3$  that define the end effector position in space, while an analytical solution is applied to calculate the angles  $\theta_4$ ,  $\theta_5$  and  $\theta_6$  which describe the end-effector orientation.

##### 4.1 Geometrical solution

According to the frame assignment shown in Figure 1, x and y components of frame {1} is the same as frame {0} because there is only a Z-directional offset between the two frames.

**Table 2.** Numerical calculation for the values x, y and z of each positions

Position	Joint angles	X vector	Y vector	Z vector
0	$\theta_1 = 0, \theta_2 = 0, \theta_3 = 0$	450	0	712
1	$\theta_1 = 0, \theta_2 = 0, \theta_3 = -90$	70	0	1092
2	$\theta_1 = 0, \theta_2 = 0, \theta_3 = 50$	314	0	420.9
3	$\theta_1 = 0, \theta_2 = 110, \theta_3 = -90$	765	0	98.9
6	$\theta_1 = 0, \theta_2 = -90, \theta_3 = 50$	1.1	0	596
7	$\theta_1 = 0, \theta_2 = 110, \theta_3 = -230$	218	0	558
8	$\theta_1 = 0, \theta_2 = -90, \theta_3 = -90$	-670	0	352

Therefore, the projection of the wrist components on x-y plane of frame  $\{0\}$  has the same components on frame  $\{1\}$  [5, 6]. In addition, since both link two and three are planar, the position vector in y direction changes with respect to  $\theta_1$  only. Thus, two possible solutions for  $\theta_1$  can be achieved by simply applying the arctangent function.

$$\theta_1 = \text{atan2} (P_y, P_x), \quad (4.1)$$

$$\theta 11 = \Pi + \theta 1. \quad (4.2)$$

The solutions of 02 and 03 are obtained by considering the plane, shown in Figure 5, formed by the second and third planar links with respect to the robot global reference frame.

**Figure 5.** Projection of links two and three onto the x y plane

The cosine law is used to solve for  $\theta_3$  as follow:

$$h^2 = (L_2)^2 + (L_3)^2 - 2 \times L_2 \times L_3 \cos (180 - \zeta)$$

Since the position is given with respect to the robot tip (TCP),  $L_3$  should be equal to  $d_4 + d_6$ . While,  $L_2 = a_2$ ,  $h^2 = s^2 + r^2$ ,  $\cos(180 - \zeta) = -\cos(\zeta)$ .

$$\begin{aligned} s^2 + r^2 &= (a_2)^2 + (d_4 + d_6)^2 + 2 \times a_2 \times (d_4 + d_6) \cos(\zeta) \\ \cos(\zeta) &= \frac{[s^2 + r^2 - (a_2)^2 - (d_4 + d_6)^2]}{2 \times a_2 \times (d_4 + d_6)} \end{aligned} \quad (4.3)$$

Now, we should have the value of (s) and (r) in term of  $\mathbf{P}_{\text{xtip}}$ ,  $\mathbf{P}_{\text{ytip}}$ ,  $\mathbf{P}_{\text{ztip}}$  and  $\mathbf{01}$ .

$$S = (P_{\text{ztip}} - d1)$$

$$r = \pm \sqrt{(\text{Pxtip} - a1 \cos(\theta1))^2 + (\text{Pytip} - a1 \sin(\theta1))^2}, \text{ Sub. (s) and (r) in (4.3) yield:}$$

$$\text{Cos}(\zeta) = \frac{[(\text{Pztip} - \text{d1})^2 + (\text{Pxtip} - \text{a1} \cos(\theta_1))^2 + (\text{Pytip} - \text{a1} \sin(\theta_1))^2 - (\text{a2})^2 - (\text{d4} + \text{d6})^2]}{2 \times \text{a2} \times (\text{d4} + \text{d6})}$$

$$\sin(\zeta) = \pm \sqrt{1 - \cos^2(\zeta)}$$

$$\zeta = \text{atan2}(\text{Sin}(\zeta), \text{Cos}(\zeta))$$

$$\text{Finally, } \theta_3 = -(90 + \zeta) \quad (4.4)$$

The negative sign in  $\theta_3$  indicates that the rotation occurred in the opposite direction. Likewise, we can follow the same procedure to solve for  $\theta_2$  using similar trigonometric relationships.

$$\theta_2 = \Omega - \lambda$$

$$\Omega = \text{atan2}(s, r)$$

$$\lambda = \text{atan2}((d_4+d_6) \sin(\zeta), a_2 + (d_4+d_6) \cos(\zeta))$$

$$\theta_2 = \text{atan2}(s, r) - \text{atan2}[(d_4+d_6) \sin(\zeta), a_2 + (d_4+d_6) \cos(\zeta)], \text{ sub the values of } (s) \text{ and } (r) \text{ yield:}$$

$$\theta_2 = \text{atan2}[(P_{z\text{tip}} - d_1), \pm \sqrt{(P_{x\text{tip}} - a_1 \cos(\theta_1))^2 + (P_{y\text{tip}} - a_1 \sin(\theta_1))^2}] \\ - \text{atan2}[(d_4+d_6) \sin(\zeta), a_2 + (d_4+d_6) \cos(\zeta)].$$

Again the rotation occurred in the opposite direction of the z axis as well as there are an initial rotation of  $90^\circ$  between axis 1 and axis 2. Therefore, the final value of  $\theta_2$  equal to:

$$\theta_2 = -((\Omega - \lambda) - 90). \quad (4.5)$$

It is important to say that any position within the robot workspace can be achieved with many orientations. Therefore, multiple solutions exist for the variables  $\theta_1$ ,  $\theta_2$  and  $\theta_3$  due to the nature of trigonometric functions.

As noticed above, every solution step resulted in two values that will be used in the next step, and so on. For example, there are four solutions for  $\zeta$  that resulted from two different values of  $\theta_1$  ( $\theta_1$  and  $\theta_{11}$ ), this procedure gives four solutions for  $\theta_3$ , each solution corresponds to different robot configurations of elbow-up and elbow-down representations. These solutions can be listed in Table 3 below to illustrate all the possible solution set.

**Table 3.** Possible solution set

Solution	THETA1	THETA3	THETA2	Set
1	$\theta_1$	$\theta_3$	$\theta_2$	SET 1
2	$\theta_1$	$\theta_3$	$\theta_{22}$	
3	$\theta_1$	$\theta_{33}$	$\theta_{2i}$	SET 2
4	$\theta_1$	$\theta_{33}$	$\theta_{22i}$	
5	$\theta_{11}$	$\theta_{3i}$	$\theta_{2j}$	SET 3
6	$\theta_{11}$	$\theta_{3i}$	$\theta_{22j}$

#### 4.2 Analytical solution

After solving the first inverse kinematic sub-problem which gives the required position of the end effector, the next step of the inverse kinematic solution will deal with the procedure of solving the orientation sub-problem to find the joint angles  $\theta_4$ ,  $\theta_5$  and  $\theta_6$ . This can be done using Z-Y-X Euler's formula. As the orientation of the tool frame with respect to the robot base frame is described in term of Z-Y-X Euler's rotation, this means that each rotation will take place about an axis whose location depends on the previous rotation [3]. The Z-Y-X Euler's rotation is shown below in Figure 6.

Figure 6. Z—Y—X Euler rotation [3]

The final orientation matrix that results from these three consecutive rotations will be as follow:

$${}^0R = R_{z'Y'X'} = R_z(\alpha) R_y(\beta) R_x(\gamma)$$

$${}^0R = \begin{pmatrix} c_\alpha & -s_\alpha & 0 \\ s_\alpha & c_\alpha & 0 \\ 0 & 0 & 1 \end{pmatrix} X \begin{pmatrix} c_\beta & 0 & s_\beta \\ 0 & 1 & 0 \\ -s_\beta & 0 & c_\beta \end{pmatrix} X \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_\gamma & -s_\gamma \\ 0 & s_\gamma & c_\gamma \end{pmatrix}$$

$${}^0R = \begin{pmatrix} c_\alpha c_\beta & c_\alpha s_\beta s_\gamma - s_\alpha c_\gamma & c_\alpha s_\beta c_\gamma + s_\alpha s_\gamma \\ s_\alpha c_\beta & s_\alpha s_\beta s_\gamma + c_\alpha c_\gamma & s_\alpha s_\beta c_\gamma - c_\alpha s_\gamma \\ -s_\beta & c_\beta s_\gamma & c_\beta c_\gamma \end{pmatrix}$$

Recall the forward kinematic equation,

$${}^0_3R = \begin{pmatrix} c_1 c_{23} & -c_1 s_{23} & -s_1 \\ s_1 c_{23} & -s_1 s_{23} & c_1 \\ -s_{23} & -c_{23} & 0 \end{pmatrix}$$

$${}^3_6R = ({}^0_3R)^T {}^0_6R$$

$${}^3_6R = \begin{pmatrix} c_1 c_{23} & s_1 c_{23} & -s_{23} \\ -c_1 s_{23} & -s_1 s_{23} & -c_{23} \\ -s_1 & c_1 & 0 \end{pmatrix} X \begin{pmatrix} c_\alpha c_\beta & c_\alpha s_\beta s_\gamma - s_\alpha c_\gamma & c_\alpha s_\beta c_\gamma + s_\alpha s_\gamma \\ s_\alpha c_\beta & s_\alpha s_\beta s_\gamma + c_\alpha c_\gamma & s_\alpha s_\beta c_\gamma - c_\alpha s_\gamma \\ -s_\beta & c_\beta s_\gamma & c_\beta c_\gamma \end{pmatrix}$$

$${}^3_6R = \begin{pmatrix} g_{11} & g_{12} & g_{13} \\ g_{21} & g_{22} & g_{23} \\ g_{31} & g_{32} & g_{33} \end{pmatrix}$$

However, it can be concluded that the last three intersected joints form a set of ZYZ Euler angles with respect to frame  $\{3\}$ . Therefore, these rotations can be expressed as:

$$R_{z'Y'Z'} = {}^3_6R = R_z(\alpha) R_y(\beta) R_z(\gamma)$$

$${}^3_6R = \begin{pmatrix} c_\alpha & -s_\alpha & 0 \\ s_\alpha & c_\alpha & 0 \\ 0 & 0 & 1 \end{pmatrix} X \begin{pmatrix} c_\beta & 0 & s_\beta \\ 0 & 1 & 0 \\ -s_\beta & 0 & c_\beta \end{pmatrix} X \begin{pmatrix} c_\gamma & -s_\gamma & 0 \\ s_\gamma & c_\gamma & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$${}^3_6R = \begin{pmatrix} c_\alpha c_\beta c_\gamma - s_\alpha s_\gamma & -c_\alpha c_\beta s_\gamma - s_\alpha c_\gamma & c_\alpha s_\beta \\ s_\alpha c_\beta c_\gamma + c_\alpha s_\gamma & -s_\alpha c_\beta s_\gamma + c_\alpha c_\gamma & s_\alpha s_\beta \\ -s_\beta c_\gamma & s_\beta s_\gamma & c_\beta \end{pmatrix}$$

Where  ${}^3_6R$  is given above as

$${}^3_6R = \begin{pmatrix} g_{11} & g_{12} & g_{13} \\ g_{21} & g_{22} & g_{23} \\ g_{31} & g_{32} & g_{33} \end{pmatrix}$$

It is possible now to use the ZYZ Euler's angles formula to obtain the solutions for  $\Theta_4$ ,  $\Theta_5$  and  $\Theta_6$  where

$$\theta_5 = \beta = \text{atan2} \left( +\sqrt{g_{31}^2 + g_{32}^2}, g_{33} \right)$$

$$\theta_4 = \alpha = \text{atan2} \left( \frac{g_{32}}{s_\beta}, \frac{-g_{31}}{s_\beta} \right)$$

$$\theta_6 = \gamma = \text{atan2} \left( \frac{g_{23}}{s_\beta}, \frac{g_{13}}{s_\beta} \right)$$

For each of the eight solutions achieved from the geometric approach for  $\Theta_1$ ,  $\Theta_2$  and  $\Theta_3$ , there is another flipped solution of  $\Theta_4$ ,  $\Theta_5$  and  $\Theta_6$  that can be obtained as:

$$\theta_{55} = \beta' = \text{atan2} \left( -\sqrt{g_{31}^2 + g_{32}^2}, g_{33} \right), \text{ Or simply } \Theta_{55} = -\Theta_5$$

$$\theta_{44} = \alpha = \text{atan2} \left( \frac{g_{32}}{s_{\beta'}}, \frac{-g_{31}}{s_{\beta'}} \right), \text{ Or simply } \Theta_{44} = 180 + \Theta_5$$

$$\theta_{66} = \gamma = \text{atan2} \left( \frac{g_{23}}{s_{\beta'}}, \frac{g_{13}}{s_{\beta'}} \right), \text{ Or simply } \Theta_{66} = 180 + \Theta_6$$

Now, if  $\beta = 0$  or  $180$ , this means that the robot in a singular configuration where the joint axes 4 and 6 are parallel. This results in a similar motion of the last three intersection links of the robot manipulator.

Alternatively:

If  $\beta = \theta_5 = 0$ , the solution will be

$$\theta_4 = \alpha = 0$$

$$\theta_6 = \gamma = \text{atan2}(-g_{12}, g_{11})$$

If  $\beta = \theta_5 = 180$ , the solution will be

$$\theta_4 = \alpha = 0$$

$$\theta_6 = \gamma = \text{atan2}(g_{12}, -g_{11})$$

## 5. Inverse Kinematic Validation

The home position of the robot in space is chosen to check the validity of the inverse kinematic solution. This position can be represented by a point ( $P_{tip}$ ) in the robot workspace. This point describes the position of the end effector (TCP) with respect to the robot base frame. By applying the inverse kinematic equations derived above, a set of joint angles is achieved. However, some of these angles do not yield a valid solution which is simply due to the fact that not all the joints can be rotated by  $360^\circ$ .

$$P_{tip}(\text{Home Position}) = [px_{tip} \ py_{tip} \ pz_{tip}]^T = [515 \ 0 \ 712]^T$$

After performing the calculations in MATLAB, four sets of solution were obtained as follow:

**Table 4.** Inverse kinematic solution sets

$\Theta_1$	$\Theta_3$	$\Theta_2$	Set
0	-180	102	SET 1
0	-180	0	
0	0	0	
0	0	-102	SET 2
180	-153	93.7	SET 3
180	-153	-23	
180	-27	23	SET 4
180	-27	-93.7	

However, because of the limitation on the joint angle range of movement [7], especially joints 2 and 3, some of these solutions (marked in **red**) are not valid. The ABB IRB 140 joint angle limits are listed below in Table 5.

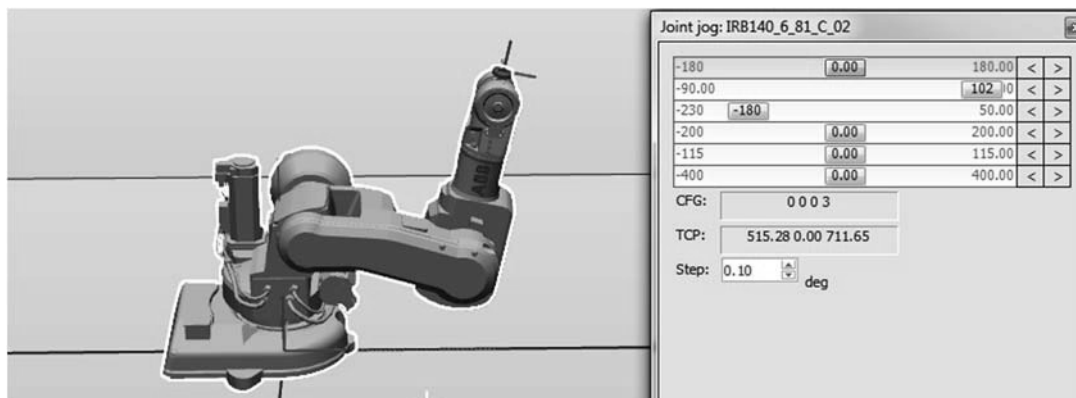

**Table 5.** ABB IRB 140 joint angle limits [7]

Joint Angle	MAX	MIN
$\Theta_1$	180	-180
$\Theta_2$	110	-90
$\Theta_3$	50	-230
$\Theta_4$	200	-200
$\Theta_5$	115	-115
$\Theta_6$	400	-400

After checking all the possible solutions with joint angle limitation table, only three valid solutions  $[(0, 0, 0), (180, -23, -153), (0, 102, -180)]$  were achieved which represent different robot configurations of the home position, elbow-up and elbow-down representations. The elbow-up configuration that corresponds to joint angles  $(180, -23, -153)$  is shown in Figure 7 below, while Figure 8 shows the elbow-down configuration that corresponds to joint angles  $(0, 102, \text{and } 180)$ . Finally, the set  $(0, 0, 0)$  represents the home position by default. It is important to note that the position vector in Robot Studio is given for the TCP with respect to the robot global reference frame. Thus to match our solution with the simulation in Robot Studio, the inverse kinematics was solved with respect to the robot TCP.

**Figure 7.** Elbow-up configuration

**Figure 8.** Elbow-down configuration

## 6. Conclusion

This work was undertaken to build the forward and inverse kinematic models of the ABB IRB 140 industrial manipulator. The Denavit-Hartenberg analysis (DH) is introduced to form the homogeneous transformation matrices. From the derived kinematic equations, it can be concluded that the position of the robot is given as a function of  $\Theta_1$ ,  $\Theta_2$  and  $\Theta_3$  only, while the three last intersection joint angles ( $\Theta_4$ ,  $\Theta_5$  and  $\Theta_6$ ) are used to give the desired orientation in space. The position vectors (x, y and z) obtained from the kinematic equations were matched with the actual robot position in the lab for the same joint angle input. Therefore, it can be declared that the kinematic derivation was carried out successfully. Two approaches have been presented to solve the inverse kinematic problem. Those were the geometrical and analytical approaches. Multiple solutions have been produced due to the nature of trigonometric functions. However, it has been shown that not all the solutions that resulted from the inverse kinematics were valid. This is basically due to the physical restrictions on the joint angle range of movement. A simulation of the manipulator in Robot Studio has been introduced to prove the validity of the inverse kinematic model. It is also used to validate the written Matlab code.
